

Hydroponics system prototype

Abstract

Egypt's imports of soybeans in the last 8 years have reached more than 17.31 million tons, and this is due to the importance of soybeans because they are used in many uses. Therefore, we decided to solve the problem and the solution is to use one of the types of hydroponics and integrate it with modern technology, but there are many obstacles to this solution, the most important of which is the high risk rate in hydroponics due to the lack of technological awareness. Therefore, we worked to provide and spread this technology at the lowest possible cost. What we have reached is that we have made a prototype of a machine that measures many sensors to increase the efficiency of the process. What we seek is to operate the system in the most automated way possible
